Solar Maintenance

WHY?

Often looked over or forgotten about is the maintenance of your most valued electrical equipment that not only saves you money but generates power for us all. Don't neglect your contribution to your community and yourself, see that it lasts the times and runs to its maximum capacity, don't let it self-destruct from neglect.

WHEN?

So the question on everyone's lips is when? Most inverters and solar panel manufacturers recommend checks for visual signs of fatigue, cleaning and electrical operational checks every 12 months.

There are exceptions where you may need more frequent checks, one situation would be when you have an almost flat solar system, you will need 3-6 monthly cleaning depending on the area.

Self Maintenance 6 Monthly

Self Checks if you can see the system from the ground

Check your inverter for the following signs:

1. Visually looks discoloured or the display isn't working
2. Wiring inputs are discoloured or look burnt
3. There is enough ventilation around the inverter to allow for air flow

Solar panel checks from the ground:

1. No signs of large bird dropping build-up
2. Low levels of dust without clay like build-up (if you can't see the solar panel below it need cleaning)
3. No wiring touching the roof
4. Nothing looks loose after a storm

Our Offer

12 Monthly Checks

1. Thermal image of the entire system

2. Electrical performance check

3. Cleaning, using water saving techniques

4. Check documentation present

5. Log and record all tests for future reference
